

Introduction

Overview

Birth of the text

Who will benefit

Why this book is relevant

Examples

CO2 emissions

Age earnings

Hedonic price function

Examples in the text

Density

Regression

Outline of the remainder of the book

Supplemental materials

Acknowledgments

Univariate density estimation

Smoothing preliminaries

Estimation

A crude estimator

Naive estimator

Kernel estimator

Kernel selection

Kernel efficiency

Bandwidth selection

Optimal selection

Data-driven methods

Plug-in or cross-validation?

Density derivatives

Bias and variance

Bandwidth selection

Relative efficiency

Application

Histograms

Kernel densities

Multivariate density estimation

Joint densities

Bias, variance, and AMISE

The curse of dimensionality

Bandwidth selection

Rule-of-thumb bandwidth selection

Cross-validation bandwidth selection

Conditional density estimation

Bias, variance, and AMSE

Bandwidth selection

Inclusion of irrelevant variables

Application

Inference about the density

Fundamentals

Consistent test

Distance measures

Centering terms

Degenerate U-statistics

Bootstrap

Equality

Parametric specification
Independence
Symmetry
Silverman test for multimodality
Testing in practice
Bootstrap versus asymptotic distribution
Role of bandwidth selection on reliability of tests

Application
Equality
Correct parametric specification
Independence
Symmetry
Modality

Regression

Smoothing preliminaries
Local-constant estimator
Derivation from density estimators
An indicator approach
Kernel regression on a constant
Bias, variance, and AMISE of the LCLS estimator
Bandwidth selection
Univariate digression
Optimal bandwidths in higher dimensions
Least-squares cross-validation
Cross-validation based on Akaike information criteria
Interpretation of bandwidths for LCLS
Gradient estimation
Limitations of LCLS
Local-linear estimation
Choosing LLLS over LCLS
Efficiency of the local-linear estimator
Local-polynomial estimation
Gradient-based bandwidth selection
Standard errors and confidence bounds
Pairs bootstrap
Residual bootstrap
Wild bootstrap
Displaying estimates
Assessing fit
Prediction
Application
Data
Results

Testing in regression

Testing preliminaries
Goodness-of-fit tests
Conditional-moment test
Correct parametric specification
Goodness-of-fit test
Conditional-moment test
Irrelevant regressors
Goodness-of-fit test
Conditional-moment test
Heteroskedasticity

Testing in practice
Bootstrap versus asymptotic distribution
Role of bandwidth selection on reliability of tests
Application
Correct functional form
Relevance
Heteroskedasticity
Density tests

Smoothing discrete variables

Estimation of a density
Kernels for smoothing discrete variables
Generalized product kernel
Finite sample properties
Discrete-only bias
Discrete-only variance
Discrete-only MSE
Mixed-data bias
Mixed-data variance
Mixed-data MSE
Bandwidth estimation
Discrete-data only
Mixed data
Why the faster rate of convergence?
Alternative discrete kernels
Testing
Application

Regression with discrete covariates

Estimation of the conditional mean
Local-constant least-squares
Local-linear least-squares
Estimation of gradients
Continuous covariates
Discrete covariates
Bandwidth selection
Automatic bandwidth selection
Upper and lower bounds for discrete bandwidths
Testing
Correct parametric specification
Significance of continuous regressors
Significance of discrete regressors
All discrete regressors
Application
Bandwidths
Elasticities
Numerical gradients
Testing

Semiparametric methods

Semiparametric efficiency
Partially linear models
Estimation
Bandwidth selection
Testing
Single-index models
Estimation

Bandwidth selection

Testing

Semiparametric smooth coefficient models

Estimation

Bandwidth selection

Testing

Additive models

Estimation

Bandwidth selection

Testing

Application

Bandwidths

Plotting estimates

Specification testing

Instrumental variables

The ill-posed inverse problem

Tackling the ill-posed inverse

Local-polynomial estimation of the control-function model

Multiple endogenous regressors

Bandwidth selection

Choice of polynomial order

Simulated evidence of the counterfactual simplification

A valid bootstrap procedure

Weak instruments

Weak identification

Estimation in the presence of weak instruments

Importance of nonlinearity in the first stage

Discrete endogenous regressor

Testing

Application

Panel data

Pooled models

Random effects

Local-linear weighted least-squares

Wang's iterative estimator

Fixed effects

Additive individual effects

Discrete individual effects

Dynamic panel estimation

Semiparametric estimators

Bandwidth selection

Standard errors

Pairs bootstrap

Residual bootstrap

Testing

Poolability

Functional form specification

Nonparametric Hausman test

Application

Bandwidths

Estimation

Testing

Constrained estimation and inference

Rearrangement

- Imposing convexity
- Existing literature
- Motivating alternative shape-constrained estimators
- Implementation methods via reweighting
- Constraint-weighted bootstrapping
- Data sharpening
- Practical issues
- Selecting the distance metric
- Choice of smoothing parameter
- Linear in p implementation issues
- Imposing additive separability
- Hypothesis testing on shape constraints
- Further extensions
- Application
 - Imposing positive marginal product
 - Imposing constant returns to scale
